1. (currently amended) A method of analyzing student performance in an electronic course, the method comprising:

classifying student performance into discrete performance classifications associated with corresponding activities;

establishing a benchmark performance level for each of the performance classifications;

measuring an observed student performance level for at least one of the performance classifications;

determining whether the observed student performance level is compliant with the established benchmark performance level for the at least one performance classification; and

identifying an instructive feedback for the individual based upon (a) any material deviation of the observed student performance level from the benchmark performance level and (b) an identity of the at least one performance classification of deficient student performance;

wherein the determining detects that a particular student has participated in a nutshell classification to a greater extent than a benchmark level and wherein an overall performance level of the particular student is lesser than an average performance level or mean performance level of other students enrolled in the same electronic course.

2. (previously presented) The method according to claim 1 wherein the discrete performance classifications comprise at least one of assignments, problems, self assessment tests, scenarios, course content overviews, subject summaries, student communications, course participation, guided problems, presentations, multimedia presentations, audio presentations, and visual presentations.

3. (original) The method according to claim 1 wherein the measuring includes tracking a number of clicks of a pointing device associated with a particular student terminal in the discrete performance classifications.
